UrbanFlow: Pitching Report

AI-Powered Adaptive Traffic Management System

Confidential Pitch Deck Supplement
Hackathon 2026

1. The Problem: Static Cities vs. Dynamic Traffic

Urban congestion is a multi-billion dollar problem caused by a fundamental mismatch: traffic is dynamic, but control systems are static.

- **Economic Waste:** Billions lost annually in fuel and productivity.
- **Environmental Toll:** Vehicles idling at red lights contribute up to 20% of urban CO_2 emissions.
- **Blind Systems:** Traditional lights operate on fixed timers, unaware of actual vehicle queues.
- **Frustration:** Drivers wait at empty intersections, leading to 'phantom' traffic jams.

2. The Solution: UrbanFlow

UrbanFlow is an autonomous ecosystem that leverages Multi-Agent Reinforcement Learning (MARL) and Computer Vision to transform intersections into intelligent nodes.

Our system follows a cycle of PERCEPTION → INTELLIGENCE → ACTION.

- **Computer Vision:** Real-time vehicle detection using mobile/CCTV feeds with YOLOv8 & OpenCV.
- **AI Optimization:** MAPPO (Proximal Policy Optimization) agents that coordinate traffic phases.
- **Sustainability Focus:** Reduces global waiting time and CO_2 emissions through 'Green Wave' optimization.

3. Technical Excellence

3.1 AI Algorithm: MAPPO

UrbanFlow uses Multi-Agent Proximal Policy Optimization. Unlike standard AI, MAPPO allows multiple intersections (agents) to cooperate.

Component	Technical Detail
Optimization	PCU-based (Passenger Car Unit) Reward System
Reward Function	reward = -(waiting_time + 10 × stopped_vehicles)
Neural Network	Actor-Critic architecture with 128 hidden neurons (PyTorch)
XAI (Explainable AI)	SHAP-based feature importance for decision transparency

3.2 Perception Pipeline

Our vision system is optimized for edge deployment using mobile cameras.

Phase	Methodology
Detection	YOLOv8 + MOG2 Background Subtraction for robust tracking
Classification	Distinguishes between Cars, Trucks, Buses, and Motorcycles
Signal Sense	HSV Color Space analysis with Hough Circle Transform
Metrics	Calculates Queue Length, Avg Speed, and Throughput in real-time

4. Dashboard & Features

- **Real-time Analytics:** Live monitoring via React 19 and Leaflet Maps.
- **Explainability:** Typewriter-animated AI logic explaining 'Why' a signal was changed.
- **CO2 Tracker:** Visualizes fuel savings based on reduced idling intervals.
- **Emergency Mode:** Automated lane clearing for sirens/emergency-priority vehicles.

5. Traditional vs. UrbanFlow

Feature	Traditional System	UrbanFlow
Logic	Fixed Timers	AI-Adaptive
Awareness	Blind	Real-world Perception
Feedback Loop	None	Real-time Reward/Adaptation
CO2 Impact	High	30-40% Reduction
Hardware	Expensive Sensors	Standard Mobile/CCTV

6. Scaling & Road-map

- V2X Integration: Communicating directly with smart vehicles for zero-latency control.
- Edge Deployment: Running inference entirely on IoT chips at the pole.
- Cloud Coordination: City-wide synchronization via centralized Firebase hubs.

7. Conclusion

UrbanFlow is not just a tool; it's the future infrastructure of smart cities. By combining multi-agent coordination with low-cost computer vision, we offer a scalable, sustainable solution to the world's traffic crisis.
